# Specification Design Pattern

*"In all kinds of applications,  
Boolean test methods appear  
that are really parts of little rules.*

*As long as they are simple,  
we handle them  
with testing methods.*

...

*But not all rules are so simple."*

Eric Evans

# Motivation Behind Specification Pattern

```
class Invoice  
{
```

```
    internal DateTime DueDate { get; set; }
```

```
    public bool IsOverdue()  
{
```

```
        DateTime currentDate = DateTime.UtcNow;  
        return currentDate > this.DueDate;  
    }
```

*Would have to depend on  
account, payment history,  
company policy, etc.*

```
    public bool IsDelinquent()  
{
```

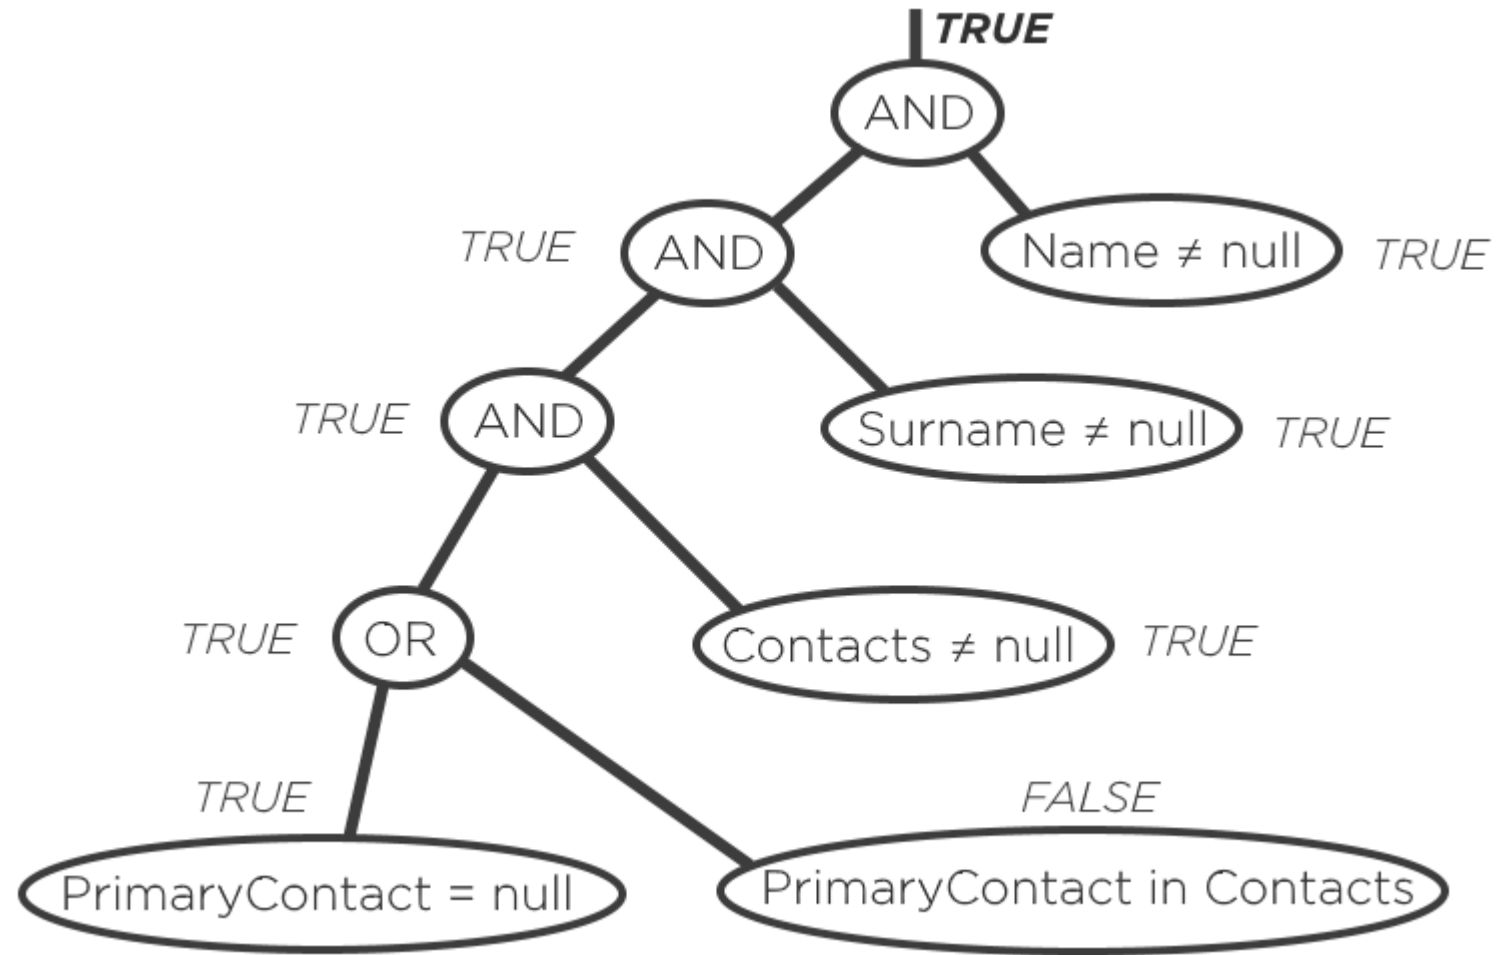

```
        ...  
    }
```

*Would have to contacts  
other objects*

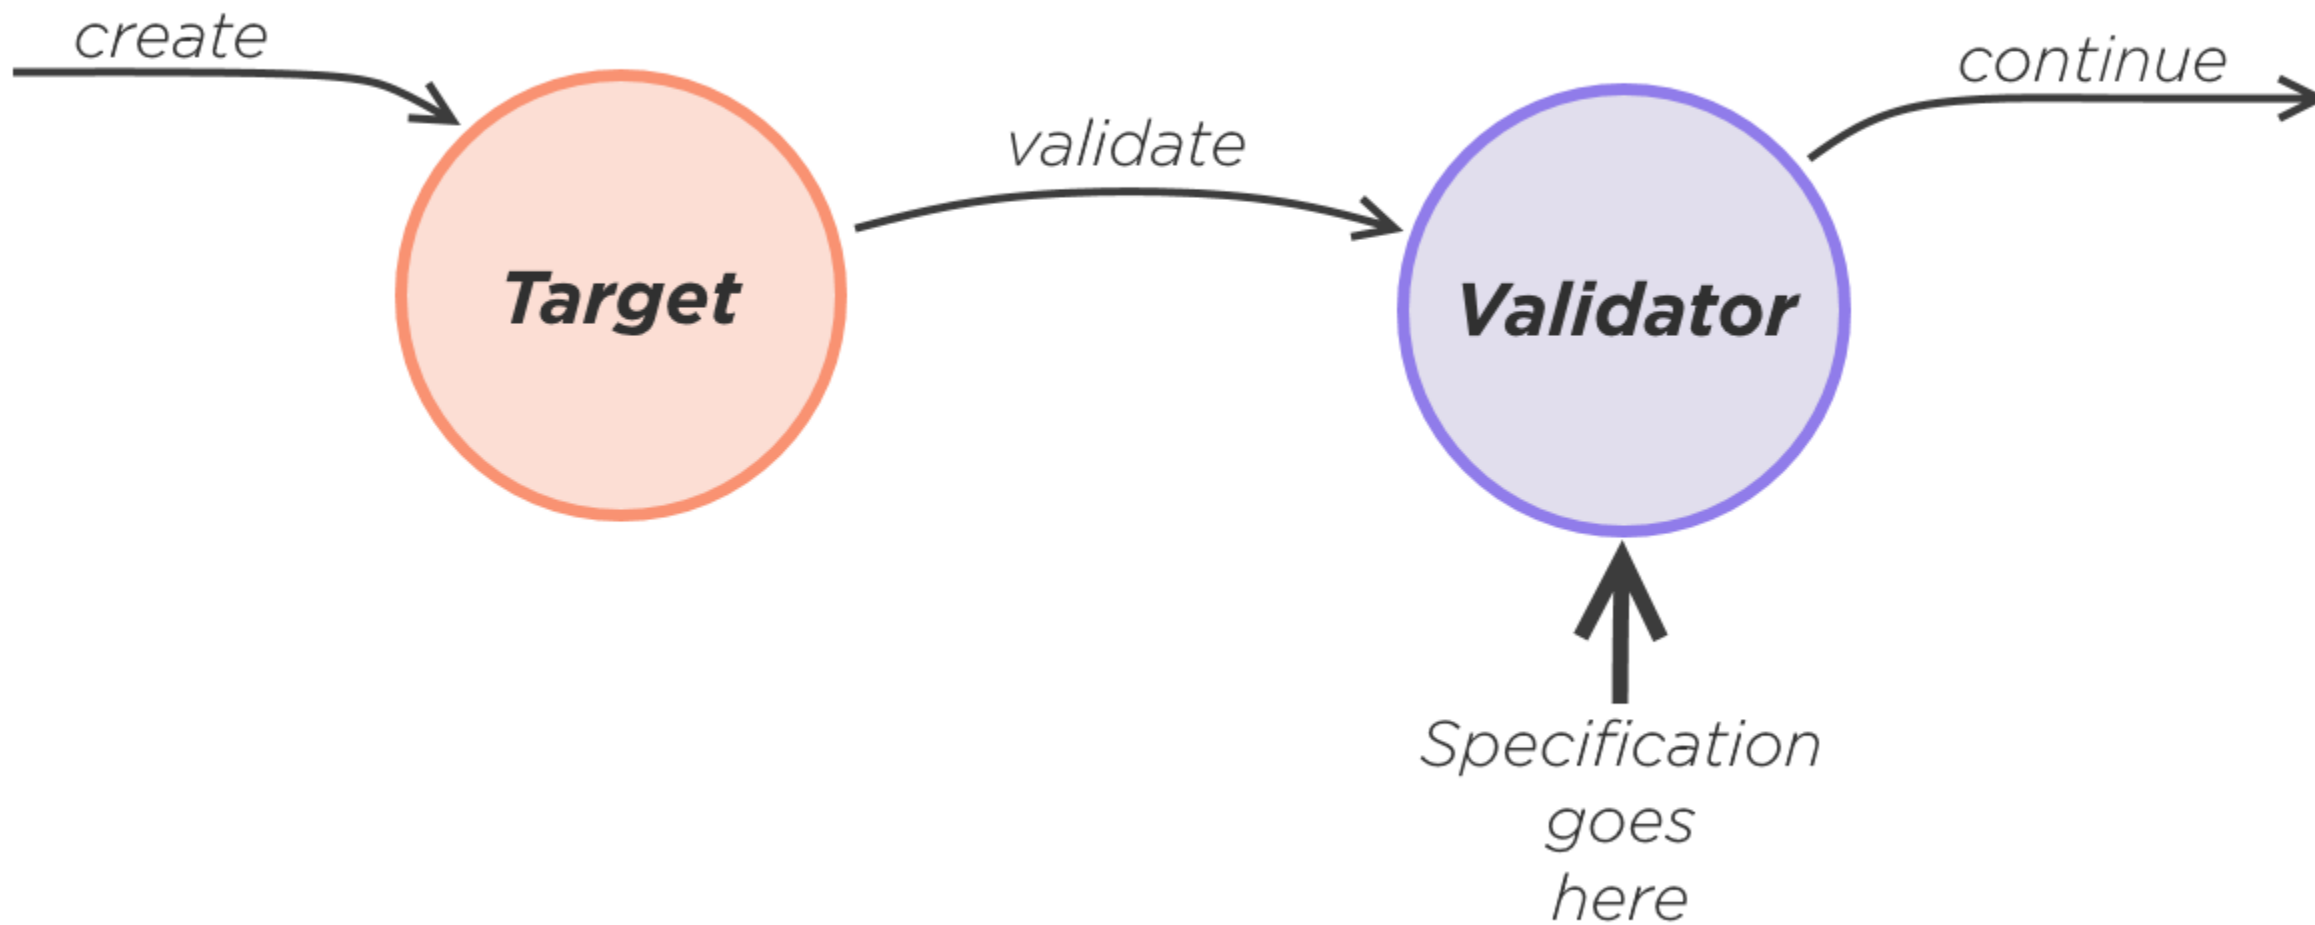

```
}
```

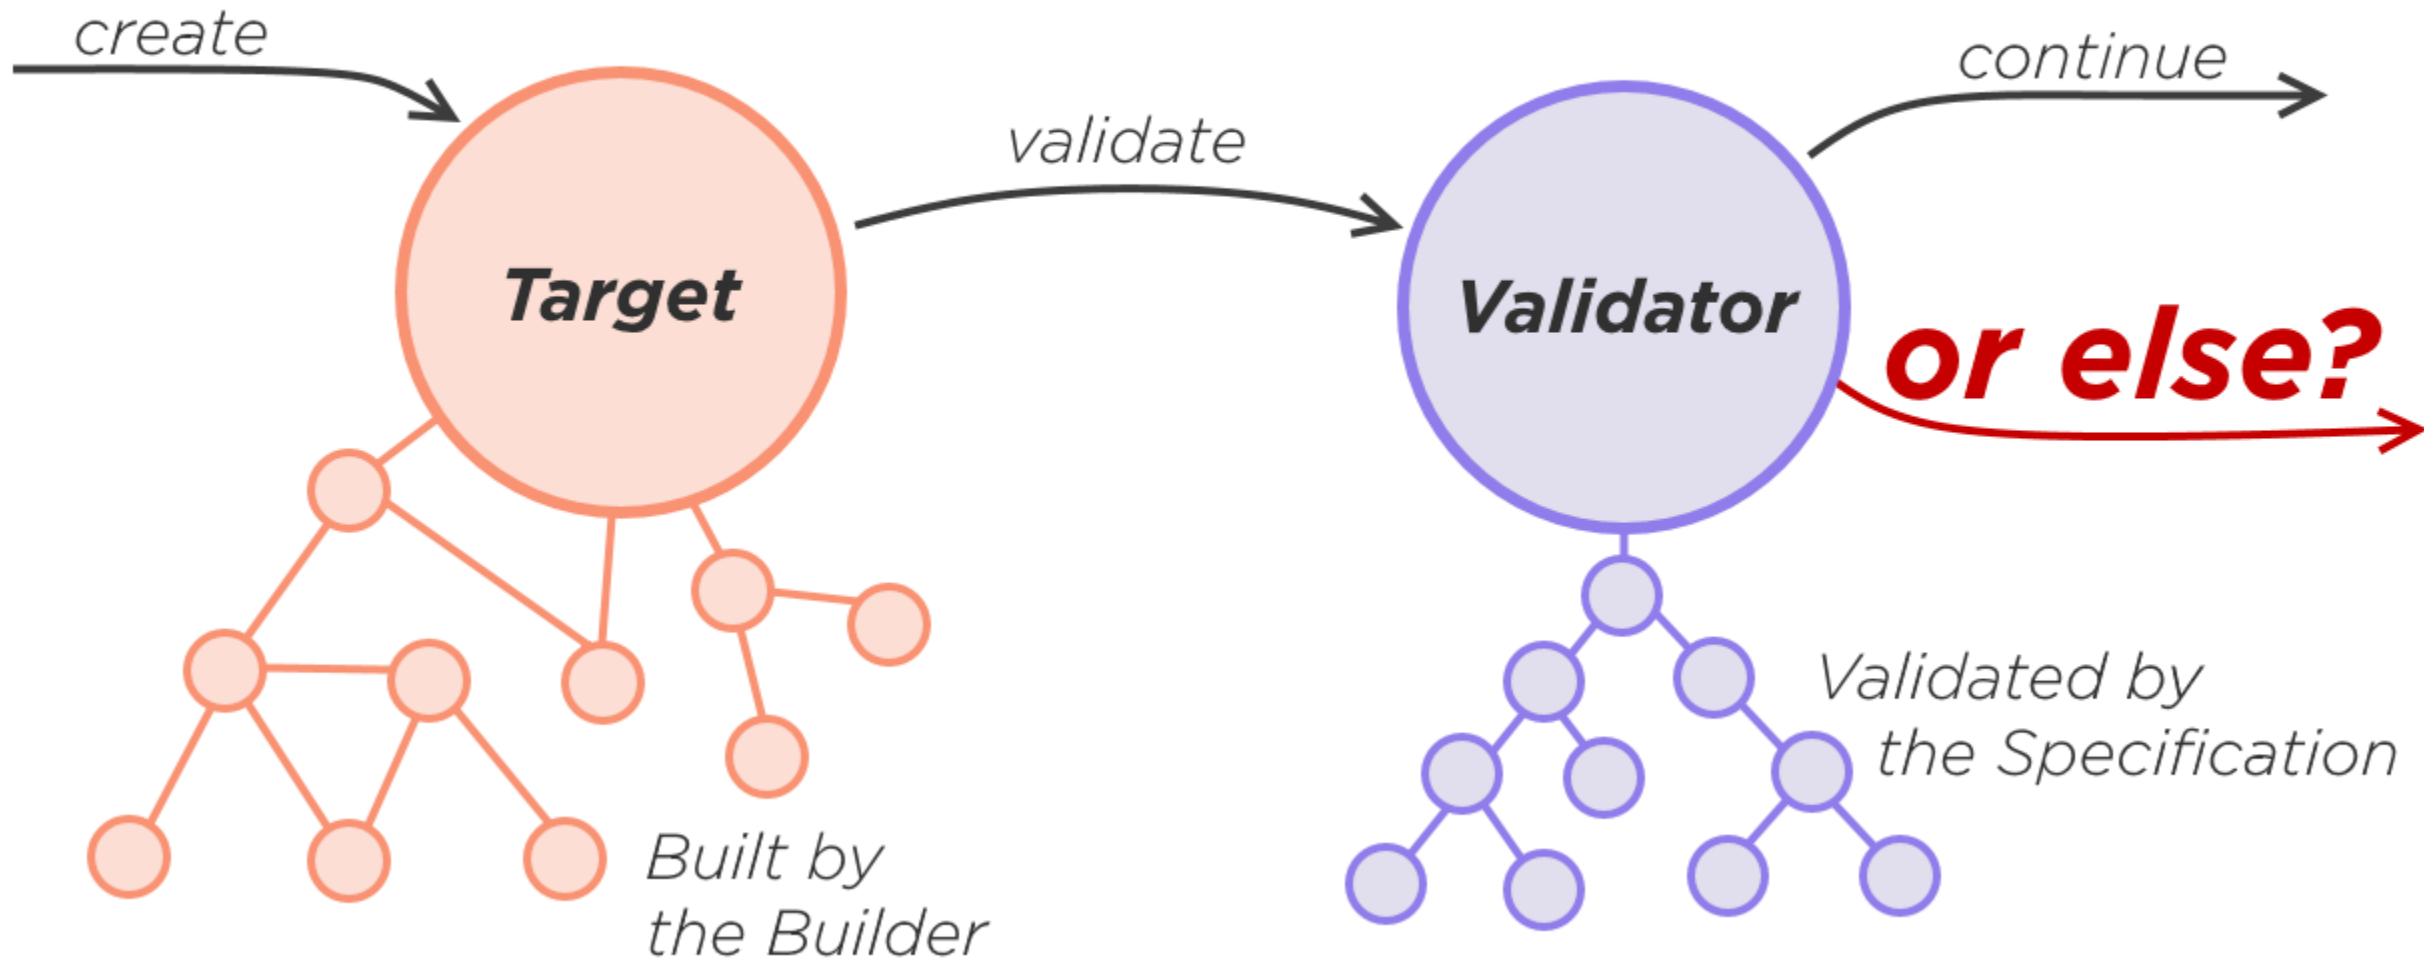

# Specification as Expression Tree

# The Building Specification Idea

# The Building Specification Idea

# Persisting Incomplete Objects

**Complex object  
may be the result  
of a long business  
transaction**

**Business transaction  
may depend on  
external events**

Waiting for the next  
user's input

Waiting for an  
outer system

**Incomplete object  
must be persisted  
before continuing**

*SELECT SUM(...) ... **WHERE DoB IS NULL or EmailAddress IS NULL***  
*SELECT AVERAGE(...) ... **WHERE DoB IS NULL or EmailAddress IS NULL***

Person			
Name	Surname	DateOfBirth	EmailAddress

*Nullable columns*

*Validating  
Specification*

Person			
Name	Surname	DateOfBirth	EmailAddress

*Incomplete objects*

**Business requirement:**

*Calculate some aggregate function*

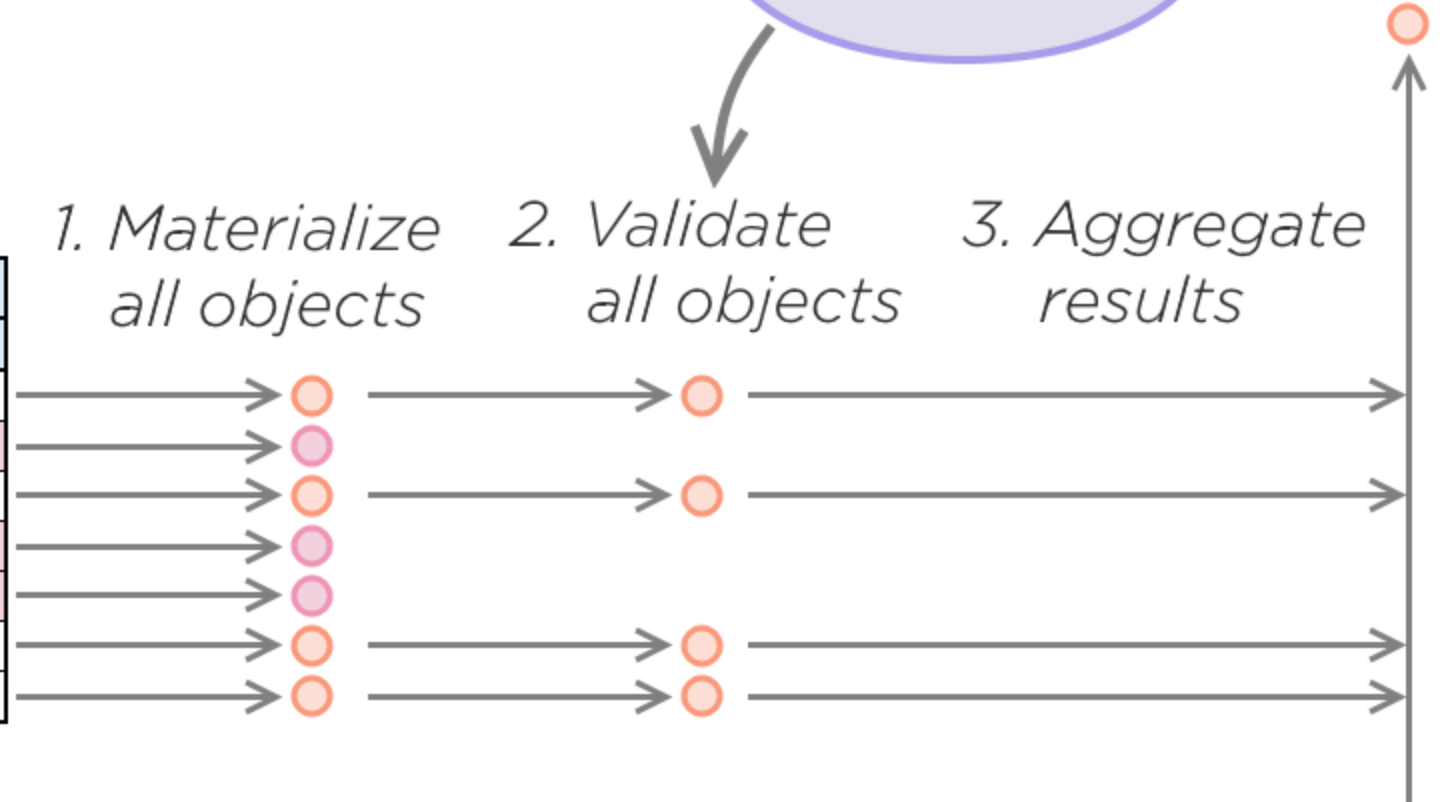

Validating  
Specification

1. Materialize  
all objects

2. Validate  
all objects

3. Aggregate  
results

Person			
Name	Surname	DateOfBirth	EmailAddress

*Validating Specification*

*Persist the results  
of the validation*

[illegible]

1. Change  
specification

Validating  
Specification

2. Materialize  
all objects

3. Validate  
all objects

4. Save new  
IsValid

Person				
Name	Surname	DateOfBirth	EmailAddress	IsValid

Person			
Name	Surname	DateOfBirth	EmailAddress

**+ Validation stored procedures**

~~Validating Specification~~

No business queries over the incomplete objects

Business queries remain the same

Building Specification

Persist specification in the database

Specification knows if object is complete

Person			
Name	Surname	DateOfBirth	EmailAddress

PersonSpecification			
Name	Surname	DateOfBirth	EmailAddress

Tables look the same

All columns can be nullable in the specification table

# Summary

## Specification design pattern

- Wraps Boolean test
- Tells whether an object is valid or not

## Object validation problem

- One object can be valid in one context
- Same object can be invalid in another context
- Boolean specifications deal well with validation

## Summary

### An attempt to unite two concepts

- Constructing a complex object
- Validating a complex object

### Building Specification pattern

- Organized like a multi-level Builder
- Builder receives parts of the product
- Building Specification receives specifications of future parts
- Building Specification forms a tree
- Construction process is recursive
